

Good Results for Prosthodontics, Implantology and Orthodontics Applications of Dental D

Full Denture

The Dental D system allows you to inject any heat or cold cured acrylic to achieve the best results in denture processing.

Rigid Partial Frameworks

Replace metal frames with this aesthetically beautiful framework that is tough but flexible.

Temporary Crowns and Bridges

Because it is biocompatible, Dental D is ideal for temporary bridges used over long periods of time. Not only is it more natural-looking, it is also inexpensive and durable.

Aesthetic Flexible Tooth-Colored Clasps

Replace metal clasps quickly and inexpensively, without removing the saddle, for a more natural look and texture.

Post-Surgical Removables

Post-surgical removables made from Dental D keep the position of teeth unchanged over long healing periods, which means patients don't have to backtrack. Because it can be used to create a very thin structure, Dental D solves aesthetic problems on anterior teeth.

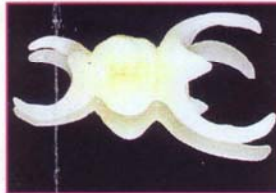

Prosthetic Implants

With Dental D as a custom implant abutment, you can use crowns made entirely of ceramic. Biocompatibility encourages gum tissue to grow over it, unlike metal, where rejection can cause unsightly gaps. Because no metallic color shows, aesthetics are improved.

Removable Bridges

Create removable bridges that snap tightly into place and are practically impossible to dislodge with the tongue. The elastic memory of Dental D makes them retain their shape when removed, unlike metal.

Posts

Posts made from Dental D flex over, around and into undercuts so you can use it where metal won't work. And they aren't subject to wear and tear.

Nightguard

Flexibly hard nightguards using the MG New Press are clear as glass, monomer free, twice as strong as acrylic and will accept soft laminate. This procedure will increase lab profits and provide excellent results.

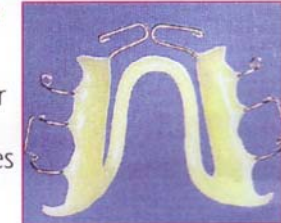

Mouth Guards and Orthodontic Positioners

Makes orthodontic devices that are autofunctional and multifunctional.

Orthodontic Devices

Dental D works for multifunctional orthodontic devices such as Hawley retainers. And it holds up to the abrasion of bruxing and grinding, making it perfect for nightguards.

Containments

More elastic and resistant to rupture, containments made from Dental D can be made smaller so they don't interfere with speech. They can also be made less visible so patients are more likely to comply with directed usage.
